Standards and Technology

john.butler@nist.gov

Step #1: Is a Mixture Present in an Evidentiary Sample?

- Examine the **number of peaks present** in a locus
 - More than 2 peaks at a locus (except for tri-allelic patterns at perhaps one of the loci examined)
- Examine **relative peak heights**
 - Heterozygote peak imbalance <60%
 - Peak at stutter position >15%
- Consider all loci tested

Step #2: Designate Allele Peaks

- Use regular data interpretation rules to decipher between true alleles and artifacts
- Use stutter filters to eliminate stutter products from consideration (although stutter may hide some of minor component alleles at some loci)
- Consider heterozygote peak heights that are highly imbalanced (<60%) as possibly coming from two different contributors

Step #3: Identifying the Potential Number of Contributors

- **Important for some statistical calculations**
- Typically if 2, 3, or 4 alleles then 2 contributors
- If 5 or 6 alleles per locus then 3 contributors
- If >6 alleles in a single locus, then >4 contributors
- **JFS Nov 2005 paper by Forensic Bioinformatics on number of possible contributors**
 - Relies on maximum allele count alone
 - Does not take into account peak height information

Abstract

DNA evidence recovered from a scene or collected in relation to a case is generally declared as a mixture when more than two alleles are observed at several loci. However, in principle, all DNA profiles may be considered to be potentially mixtures, even those that show not more than two alleles at any locus. When using a likelihood ratio approach to the interpretation of mixed DNA profiles it is necessary to postulate the number of potential contributors. However, this number is never known with certainty. The possibility of a, say three person mixture, presenting four or fewer peaks at each locus of the CODIS set was explored by Paoletti *et al.* (D.R. Paoletti, T.E. Doon, C.M. Krane, M.L. Raymer, D.E. Krane, Empirical analysis of the STR profiles resulting from conceptual mixtures, *J. Forensic Sci.* 50 (2005) 1361–1366). In this work we extend this analysis to consider the profiler plus and SGM plus multiplexes. We begin the assessment of the risk associated with current practice in the calculation of LR's. We open the discussion of possible ways to surmount this ambiguity.

Buckleton *et al.* (2007) Towards understanding the effect of uncertainty in the number of contributors to DNA stains. *FSI Genetics* 1:20-28

Number of Alleles Observed with Simulated Four-Person Mixtures

- The simulation of four person mixtures suggests that 0.014% of four person mixtures would show four or fewer alleles and that 66% would show six or fewer alleles for the SGM Plus loci.
- The results for the Profiler Plus loci were 0.6% and 75%.
- The equivalent values for the CODIS set from Paoletti *et al.* were 0.02% showing four or fewer and 76.35% showing six or fewer.

Buckleton *et al.* (2007) Towards understanding the effect of uncertainty in the number of contributors to DNA stains. *FSI Genetics* 1:20-28

Step #4: Estimation of Relative Ratios for Major and Minor Components to a Mixture

- Mixture studies with known samples have shown that the mixture ratio between loci is fairly well preserved during PCR amplification
- Thus it is generally thought that the peak heights (areas) of alleles present in an electropherogram can be related back to the initial component concentrations
- Start with loci possessing 4 alleles...

Estimating Mixture Proportion (M_x) or Mixture Ratio (M_r)

$$M_x = \frac{\phi_a + \phi_b}{\phi_a + \phi_b + \phi_c + \phi_d}$$

$$\frac{A + D}{A + D + B + C} = \frac{1611 + 1158}{1611 + 1158 + 3122 + 3193} = \frac{2769}{9084} = 0.305$$

Step #5: Consider All Possible Genotype Combinations

Table 3
Pairwise combinations of two, three and four alleles:

Four alleles (a,b,c,d)		Three alleles (a,b,c)		Two alleles (a,b)	
a,b	c,d	a,a	b,c	a,a	a,b
a,c	b,d	b,b	a,c	a,b	a,b
a,d	b,c	c,c	a,b	a,a	b,b
c,d	a,b	a,b	a,c	a,b	b,b
b,d	a,c	b,c	a,c	a,b	a,a
b,c	a,d	a,b	b,c	b,b	a,a
		b,c	a,a	b,b	a,b
		a,c	b,b		
		a,b	c,c		
		a,c	a,b		
		a,c	b,c		
		b,c	a,b		

Key: bold entries represent reciprocal combinations.

Clayton *et al. Forensic Sci. Int.* 1998; 91:55-70

Step #5: Consider All Possible Genotype Combinations

1 = major component 2 = major component

1 2 AA BC		
1 2 BB AC		
1 2 CC AB		
1 2 AB AC		
1 2 BC AC		
1 2 AB BC		

Figure 7.7. J.M. Butler (2005) *Forensic DNA Typing*, 2nd Edition © 2005 Elsevier Academic Press

Possible Genotype Combinations for a two person mixture

Four Peaks

- heterozygote + heterozygote, no overlapping alleles (genotypes are unique)

Three Peaks

- heterozygote + heterozygote, one overlapping allele
- heterozygote + homozygote, no overlapping alleles (genotypes are unique)

Two Peaks

- heterozygote + heterozygote, two overlapping alleles (genotypes are identical)
- heterozygote + homozygote, one overlapping allele
- homozygote + homozygote, no overlapping alleles (genotypes are unique)

Single Peak

- homozygote + homozygote, overlapping allele (genotypes are identical)

Genotype Combinations and Allele Overlap Observed in One Forensic Lab

Table 4
Resolution of genotypes in mixed samples depending on knowledge of the contributors' profile (no. of observations = 280)

	Total (%)
Four peaks	
Heterozygote + heterozygote (non-overlapping alleles)	28 (13)
Three peaks	
Heterozygote + heterozygote (one overlapping allele)	72 (34)
Heterozygote + homozygote (non-overlapping alleles)	33 (16)
Two peaks	
Heterozygote + heterozygote (one overlapping allele)	39 (18)
Heterozygote + heterozygote (two overlapping alleles)	15 (7)
Homozygote + homozygote (non-overlapping alleles)	7 (3)
One peak	
Homozygote + homozygote (overlapping allele)	5 (2)
Allele dropouts	11 (5)

Step #6: Compare Reference Samples

- If there is a suspect, a laboratory must ultimately decide to include or exclude him...
- If no suspect is available for comparison, does your laboratory still work the case? (Isn't this a primary purpose of the national DNA database?)
- Victim samples can be helpful to eliminate their allele contributions to intimate evidentiary samples and thus help deduce the perpetrator

- Tom Overson's USACIL program permits reference sample comparisons

Kit Comparability on the Same Mixture Samples

Table 1.- Characteristics of the commercial kits in the detection of mixtures in 55 casework non-probative samples^a

Gill *et al.* (2006) DNA Commission of the International Society of Forensic Genetics: Recommendations on the interpretation of mixtures. *Forensic Sci. Int.* 160: 90-101

ISFG (2006) Recommendations

- **Recommendation 1:** The likelihood ratio is the preferred approach to mixture interpretation. The RMNE (probability of exclusion) approach is restricted to DNA profiles where the profiles are unambiguous. If the DNA crime stain profile is low level and some minor alleles are the same size as stutters of major alleles, and/or if drop-out is possible, then the RMNE method may not be conservative.

Gill *et al.* (2006) DNA Commission of the International Society of Forensic Genetics: Recommendations on the interpretation of mixtures. *Forensic Sci. Int.* 160: 90-101

ISFG (2006) Recommendations

- **Recommendation 2:** Even if the legal system does not implicitly appear to support the use of the likelihood ratio, it is recommended that the scientist is trained in the methodology and routinely uses it in case notes, advising the court in the preferred method before reporting the evidence in line with the court requirements. The scientific community has a responsibility to support improvement of standards of scientific reasoning in the court-room.

Gill *et al.* (2006) DNA Commission of the International Society of Forensic Genetics: Recommendations on the interpretation of mixtures. *Forensic Sci. Int.* 160: 90-101

ISFG (2006) Recommendations

- **Recommendation 3:** The methods to calculate likelihood ratios of mixtures (not considering peak area) described by Evett *et al.* (*J. Forensic Sci. Soc.* 1991;31:41-47) and Weir *et al.* (*J. Forensic Sci.* 1997;42:213-222) are recommended.

Gill *et al.* (2006) DNA Commission of the International Society of Forensic Genetics: Recommendations on the interpretation of mixtures. *Forensic Sci. Int.* 160: 90-101

ISFG (2006) Recommendations

- **Recommendation 4:** If peak height or area information is used to eliminate various genotypes from the unrestricted combinatorial method, this can be carried out by following a sequence of guidelines based on Clayton *et al.* (*Forensic Sci. Int.* 1998;91:55-70).

Gill *et al.* (2006) DNA Commission of the International Society of Forensic Genetics: Recommendations on the interpretation of mixtures. *Forensic Sci. Int.* 160: 90-101

ISFG (2006) Recommendations

- **Recommendation 5:** The probability of the evidence under H_p is the province of the prosecution and the probability of the evidence under H_d is the province of the defense. The prosecution and defense both seek to maximize their respective probabilities of the evidence profile. To do this both H_p and H_d require pairs of propositions. There is no reason why multiple pairs of propositions may not be evaluated (Appendix C).

Gill *et al.* (2006) DNA Commission of the International Society of Forensic Genetics: Recommendations on the interpretation of mixtures. *Forensic Sci. Int.* 160: 90-101

ISFG (2006) Recommendations

- **Recommendation 6:** If the crime profile is a major/minor mixture, where minor alleles are the same size (height or area) as stutters of major alleles, then stutters and minor alleles are indistinguishable. Under these circumstances alleles in stutter positions that do not support H_p should be included in the assessment.
- In general, stutter percentage is <15%

Gill *et al.* (2006) DNA Commission of the International Society of Forensic Genetics: Recommendations on the interpretation of mixtures. *Forensic Sci. Int.* 160: 90-101

ISFG (2006) Recommendations

- **Recommendation 7:** If drop-out of an allele is required to explain the evidence under H_p : ($S = ab$; $E = a$), then the allele should be small enough (height/area) to justify this. Conversely, if a full crime stain profile is obtained where alleles are well above the background level, and the probability of drop-out approaches $Pr(D) \approx 0$, then H_p is not supported.

Gill *et al.* (2006) DNA Commission of the International Society of Forensic Genetics: Recommendations on the interpretation of mixtures. *Forensic Sci. Int.* 160: 90-101

ISFG (2006) Recommendations

- **Recommendation 8:** If the alleles of certain loci in the DNA profile are at a level that is dominated by background noise, then a biostatistical interpretation for these alleles should not be attempted.

Gill *et al.* (2006) DNA Commission of the International Society of Forensic Genetics: Recommendations on the interpretation of mixtures. *Forensic Sci. Int.* 160: 90-101

ISFG (2006) Recommendations

- **Recommendation 9:** In relation to low copy number, stochastic effects limit the usefulness of heterozygous balance and mixture proportion estimates. In addition, allelic drop-out and allelic drop-in (contamination) should be taken into consideration of any assessment.

Gill *et al.* (2006) DNA Commission of the International Society of Forensic Genetics: Recommendations on the interpretation of mixtures. *Forensic Sci. Int.* 160: 90-101
