

DNA Mixture Analysis:

Principles and Practice of Mixture Interpretation and Statistical Analysis
Using the SWGDAM STR Interpretation Guidelines

Training Your Staff to Consistently Interpret Mixtures

Ray Wickenheiser

February 22, 2011

NIST

Outline

- Underlying principles
- The process
- Identify decision points
- Move from areas of agreement
- Identify zones of disagreement
- Seek objective authority
- Mixture flowcharts
- ROI

Underlying principles

- Consistent approach
- Scientifically valid
- Conservative
- Does not leave data on the table
- Easy to understand and explain

Does your lab interpret mixtures consistently?

DNA MIXTURES

Harness the power?

- Or prepare for meltdown?

The process

- It is a continuous process, built over time
- Staff built rather than dictated by management
- Management support and direction, but content driven by analysts and TL
- Same data, different conclusion? Consistency a scientific imperative, but also leads to efficiency which in turn creates cost savings!

Identify the decision points

- Making decisions on tipping points (Peak height ratios, thresholds, major to minor ratios)
- Quantifying the indecision and establishing thresholds
- 100 cut-off, what about 99, then 98, then 95. This is the slippery slope. There is always a line in the sand. Quantify the line.

PHASE TWO: INTERPRETATION

Use common themes

- Recognizing recurring themes of mixture types
- Sharing joint experiences (the experience of one becomes the experience of all)
- Nurturing a atmosphere of open debate and sharing of opinions
- Management support rather than micromanagement and dictation

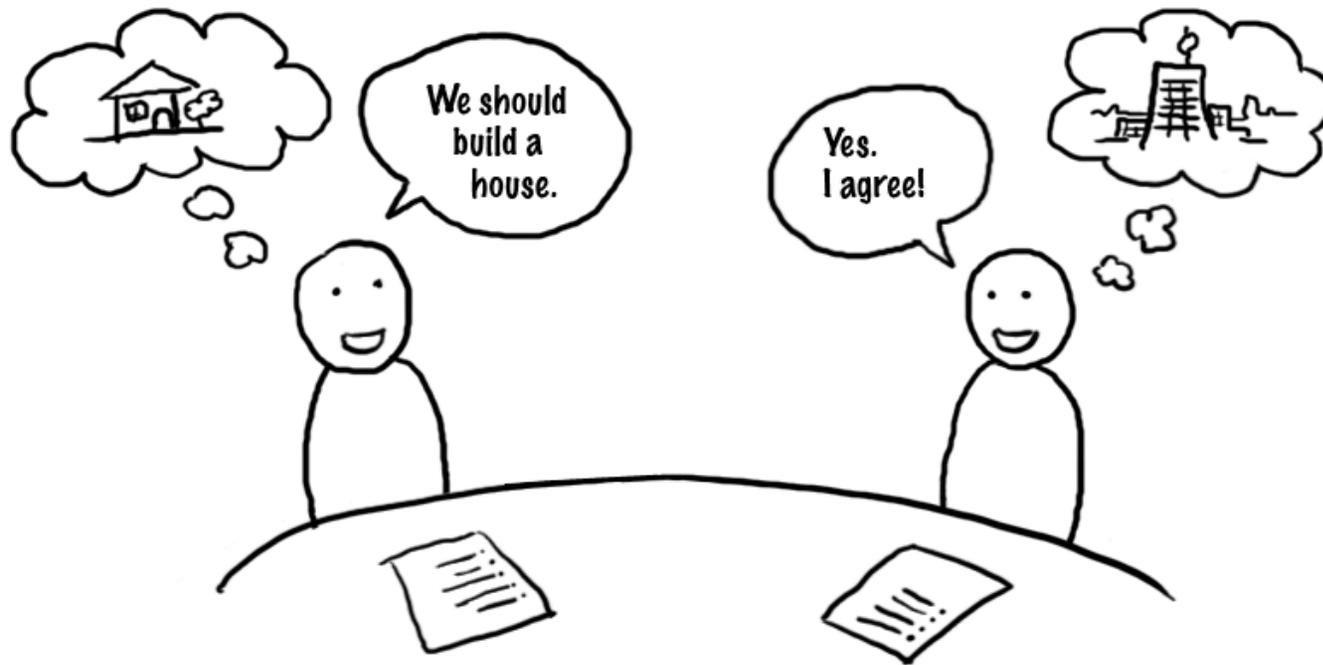

Move from areas of agreement

- Retaining best practices while moving forward
- Establishing zones of agreement while highlighting differences for further debate and refinement
- Keeping an open mind
- Moving from rigid positions to focusing on the issue
- Facilitated technique of conflict resolution – putting it up on the board for all to see, shifts the focus to the problem, then brainstorm.

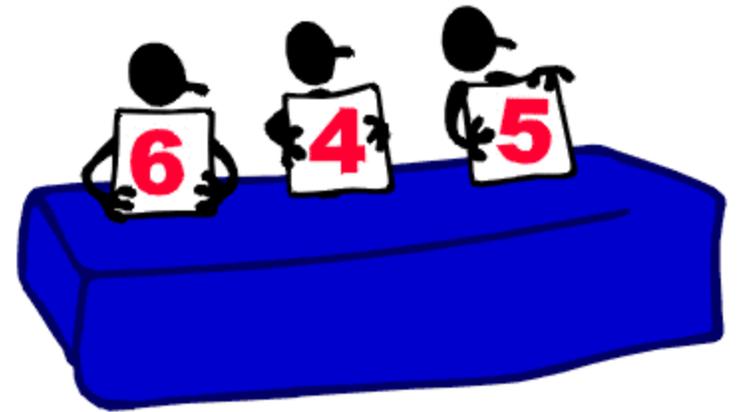

Sharing a joint vision

Identify areas of disagreement

- Identifying and winning over the “Russian Judge”
- Pinpoint areas where you disagree
- Agree to disagree, then come back to them later
- This permit individuals to move slowly away from entrenched positions while “saving face”
- Tough on the problem, easy on individuals
- Retaining case examples to pinpoint issues in real case examples

Consider using a image projector

- Display evolving document in full view of all
- Moves the focus from person against person to people against the issues
- Ensures full communication
- Ensures everyone feels part of the solution
- Making the solution your own – everyone has a stake

Seek Objective Authority

- What are other labs doing?
- Scientists love to have their work “borrowed”
- Remember to use references
- Meeting and debating with other labs in user forums such as the CE user group meetings
- Obtaining outside training to expose to different ways of solving areas of disagreement

Quantify the grey areas

- Permitting examiner discretion within a framework
- Constantly checking and improving the framework based on other labs, developments in the field and ongoing case experience.
- Common point of agreement: Picking a major over a minor in a two person mixture
- Disagreement: When can I call the major or when can I use a known to subtract
- The time to have the debate is before the case is yours.

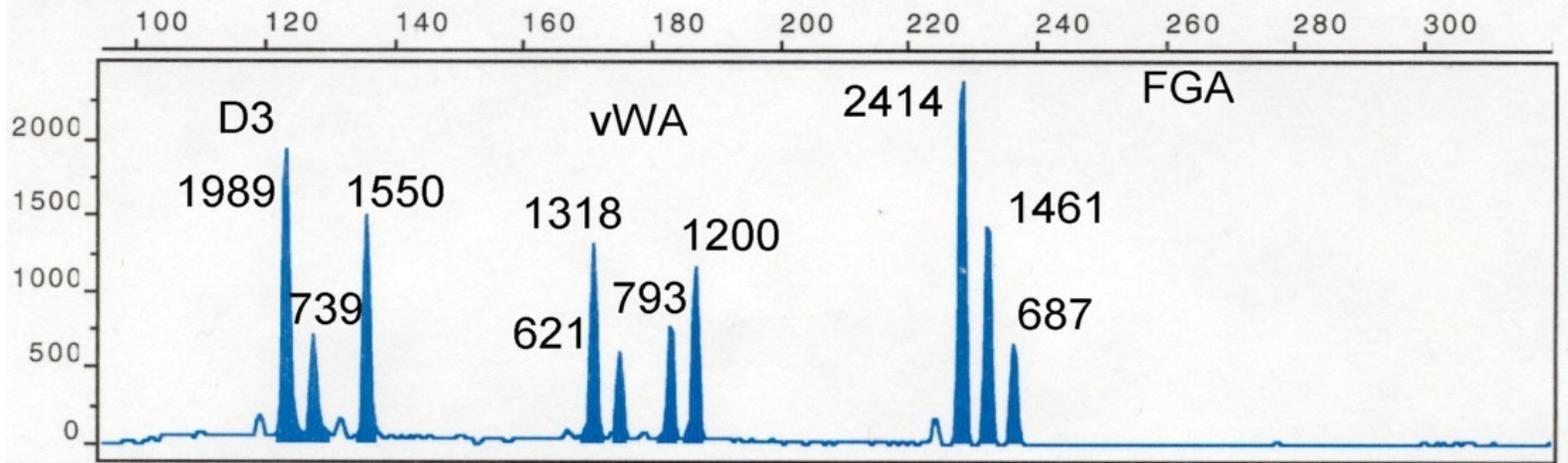

"Say ... what's a mountain goat doing way up here in a cloud bank?"

10 Steps to Mixture Interpretation

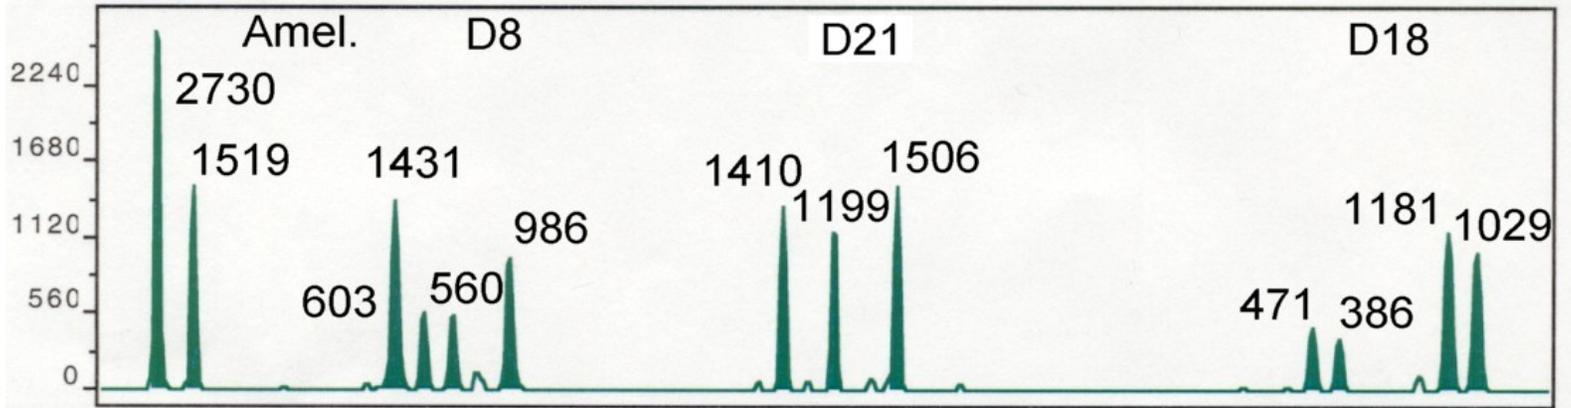

1. Know your **sample** and its forensic context
2. Develop the DNA **profile**
3. **Survey** the profile (entire profile overview)
4. **Sift** – arrive at the callable peaks and profile
5. Does sample **context** or features add value?

10 Steps (cont.)

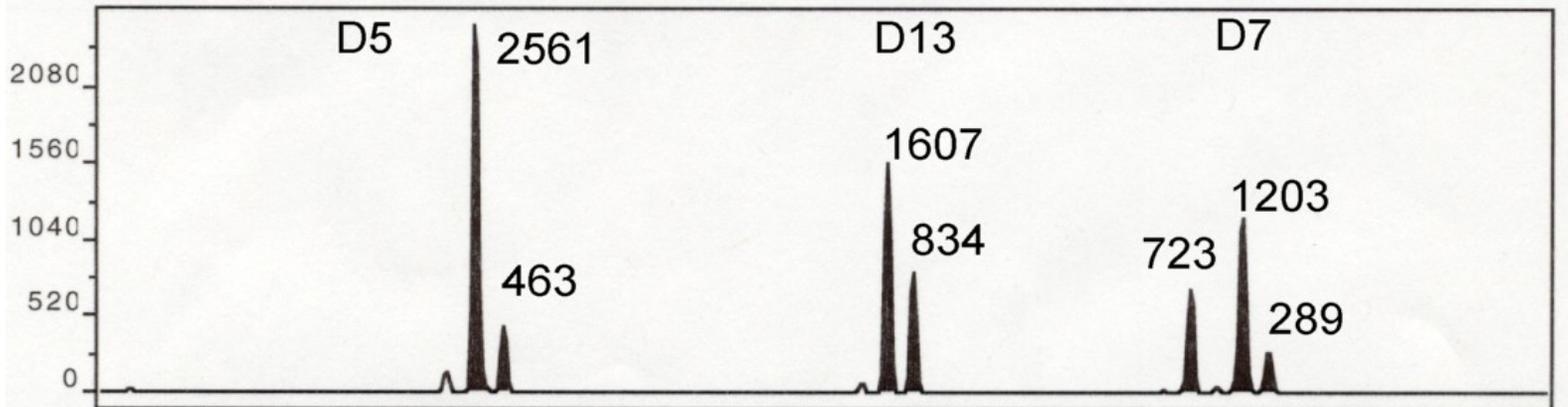

6. Do peak **heights** add value?
7. Sort - If profile is a mixture, determine mixture **type**
8. Can a sole **source** be identified?
9. What confidence can be applied to **minor** contributors?
10. **Compare** to known profiles – if included, with how much reliability?

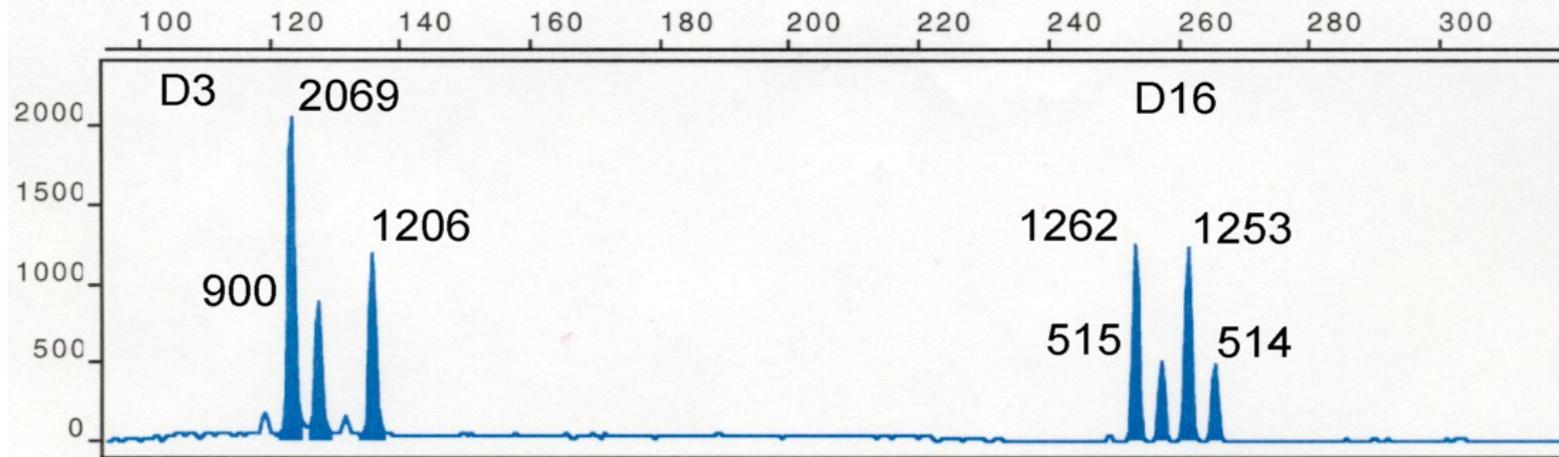

11B : 01-1215/01-6B / 01-1215/01-6B, vaginal slide

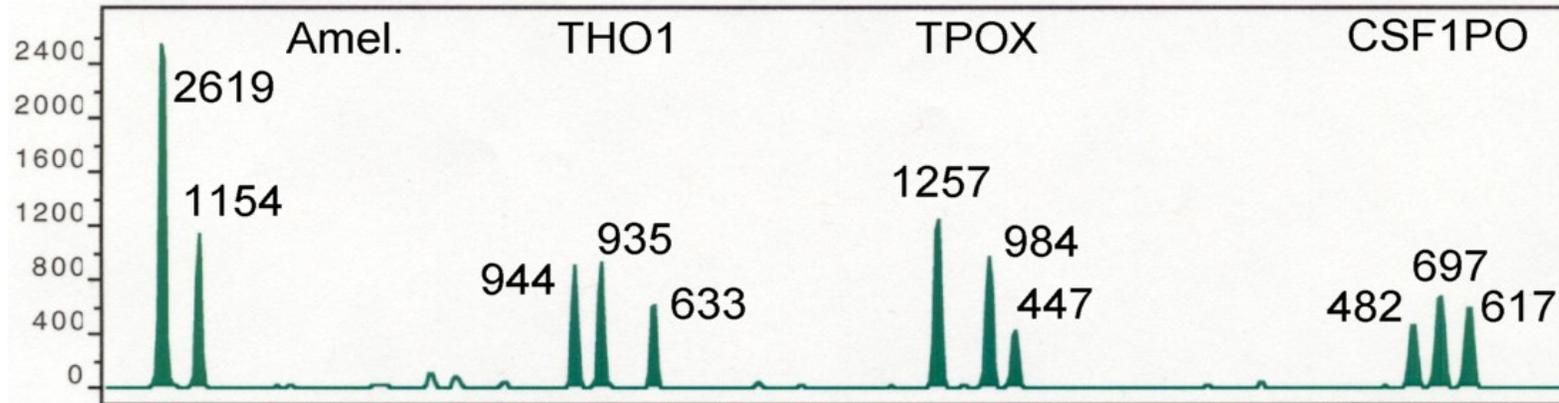

11G : 01-1215/01-6B / 01-1215/01-6B, vaginal slide

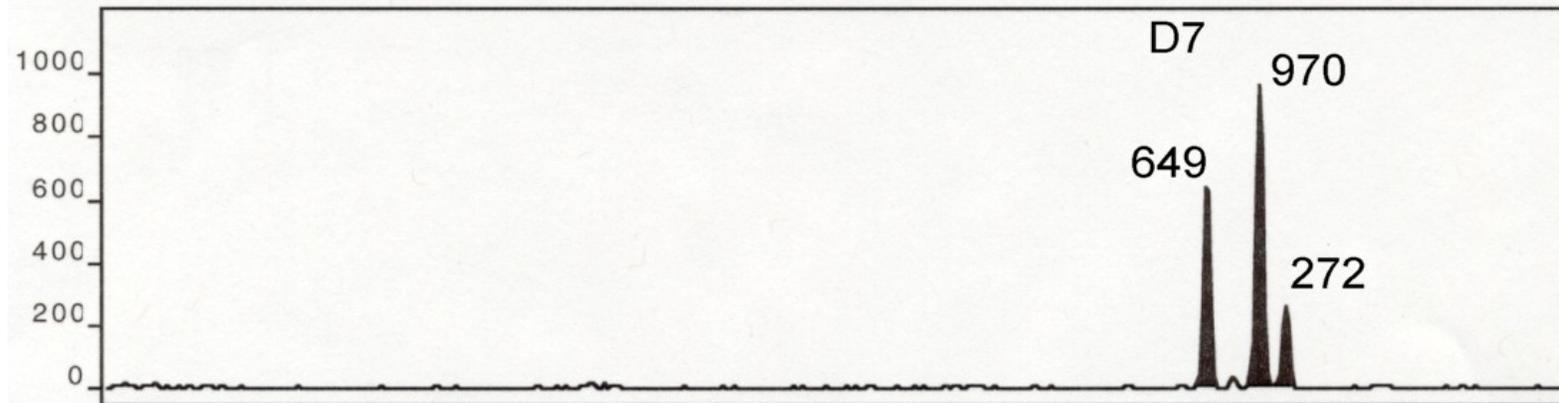

11Y : 01-1215/01-6B / 01-1215/01-6B, vaginal slide

52B : 01-1215/01-6B* / 01-1215/01-6B, vaginal slide*

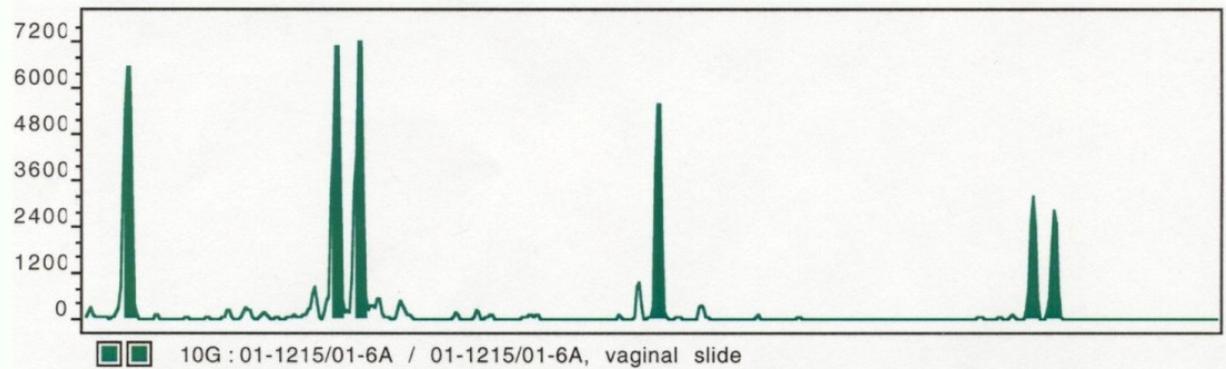

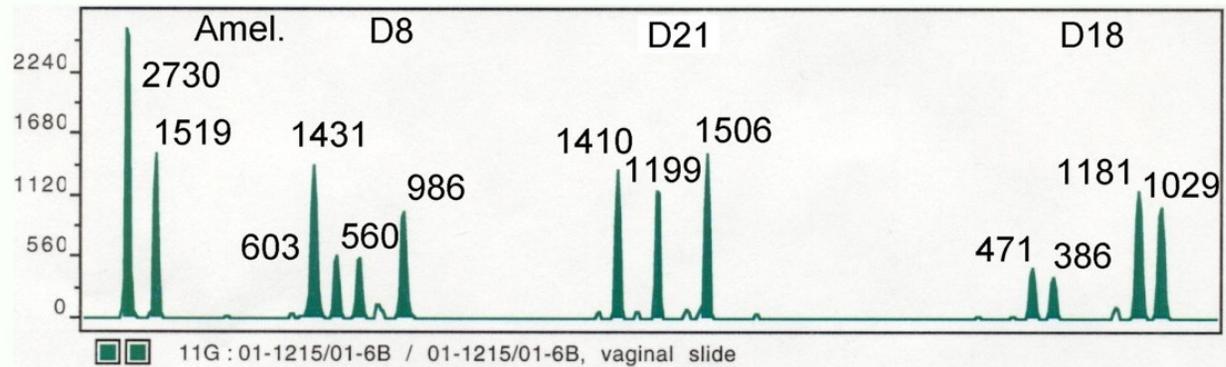

52G : 01-1215/01-6B* / 01-1215/01-6B, vaginal slide*

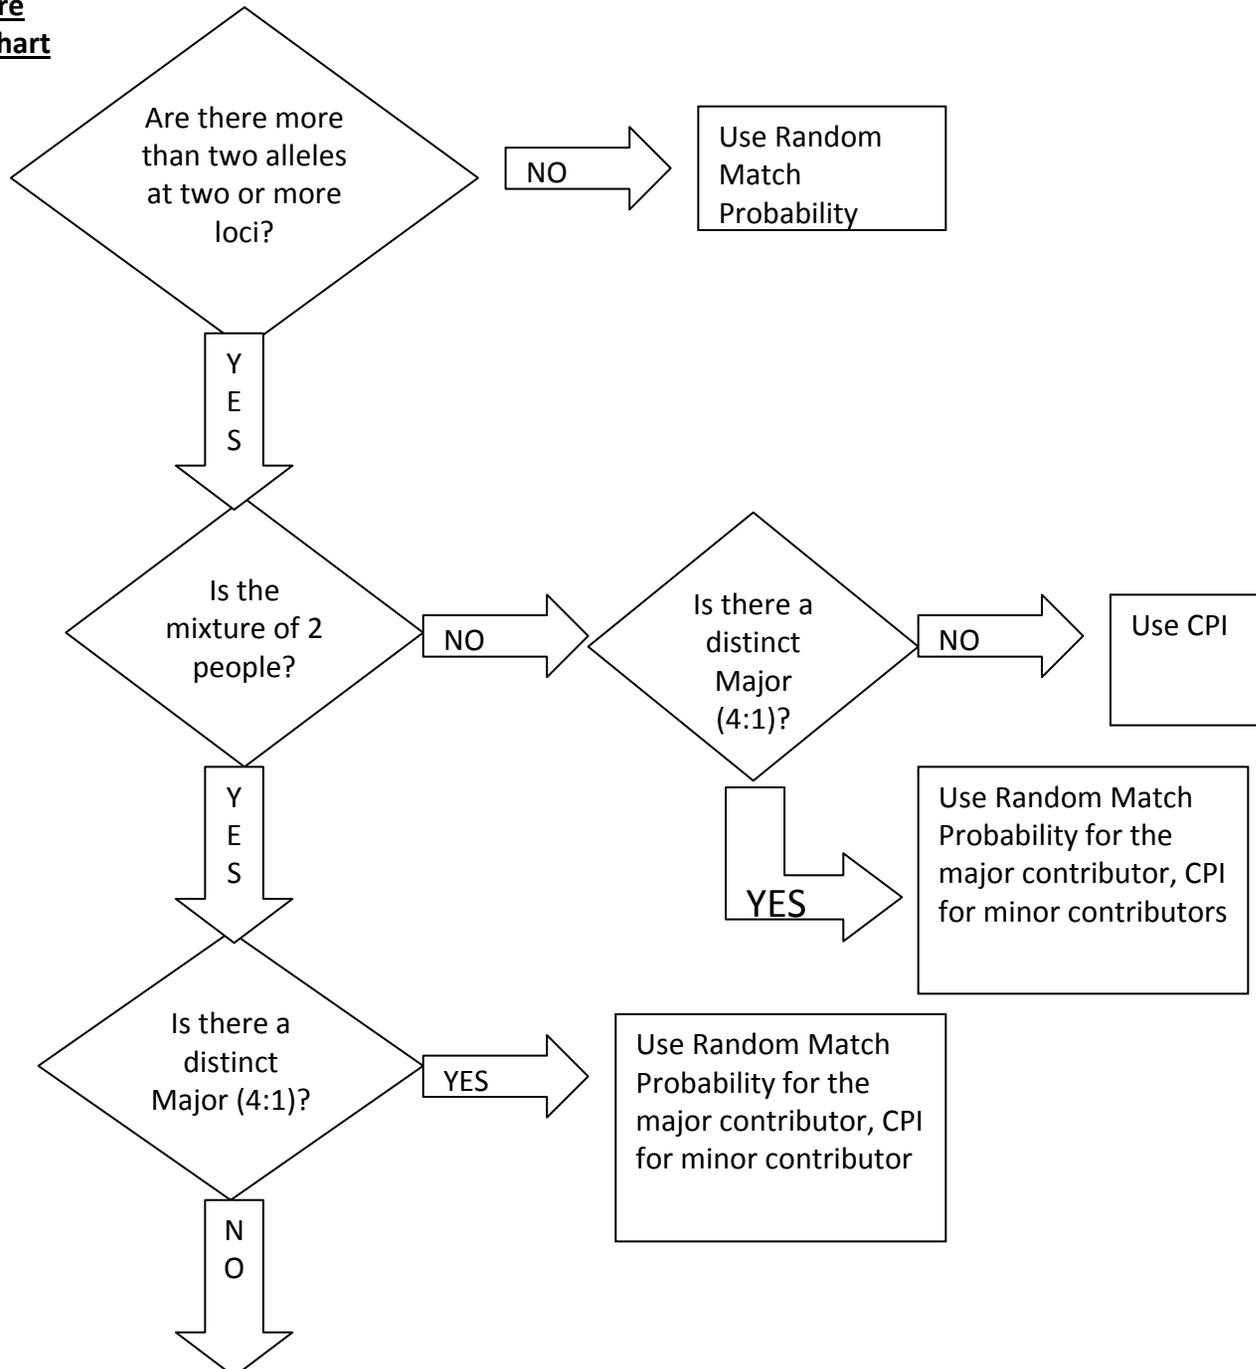

52Y : 01-1215/01-6B* / 01-1215/01-6B, vaginal slide*

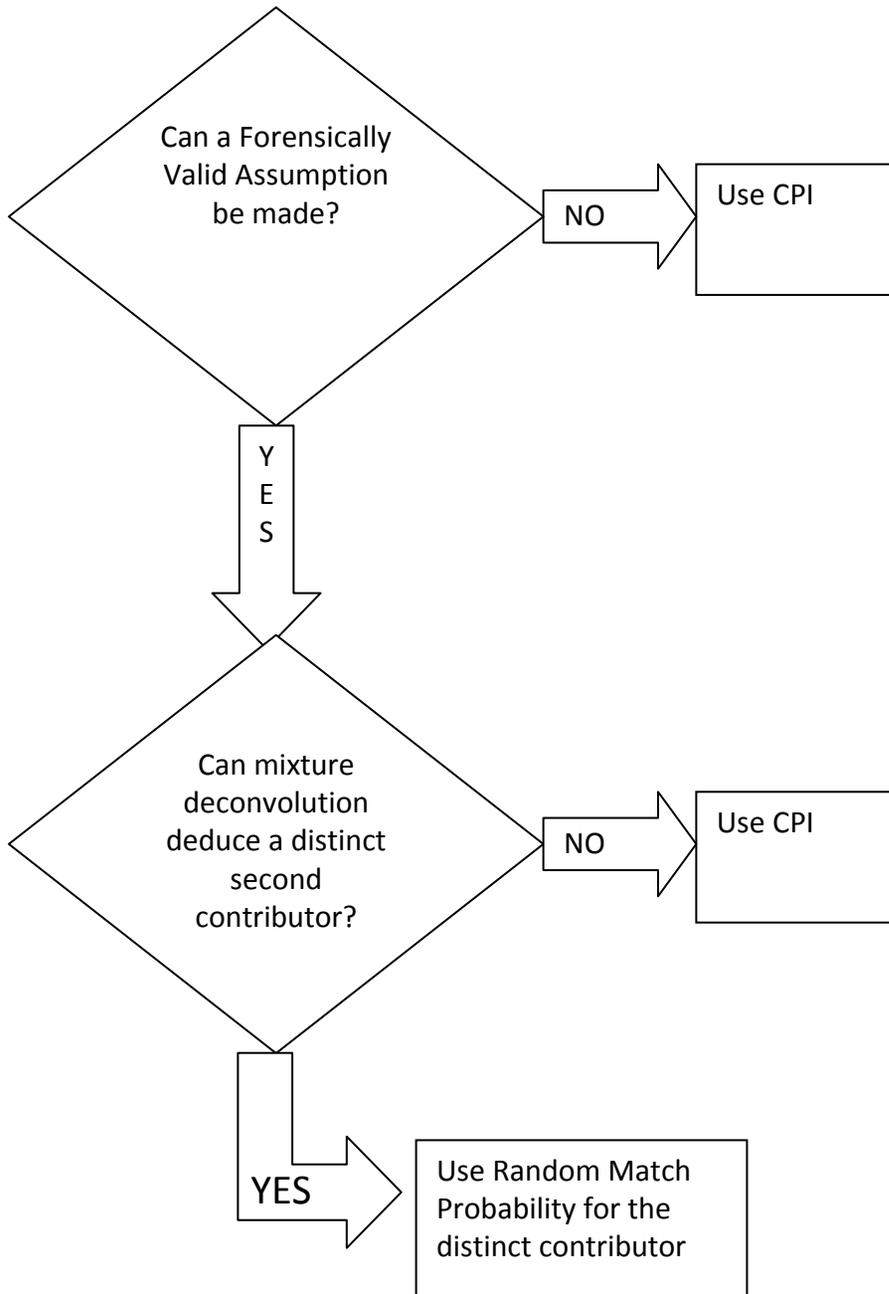

D21, D5, TH01 and CSF are ambiguous,
unless you use another profile

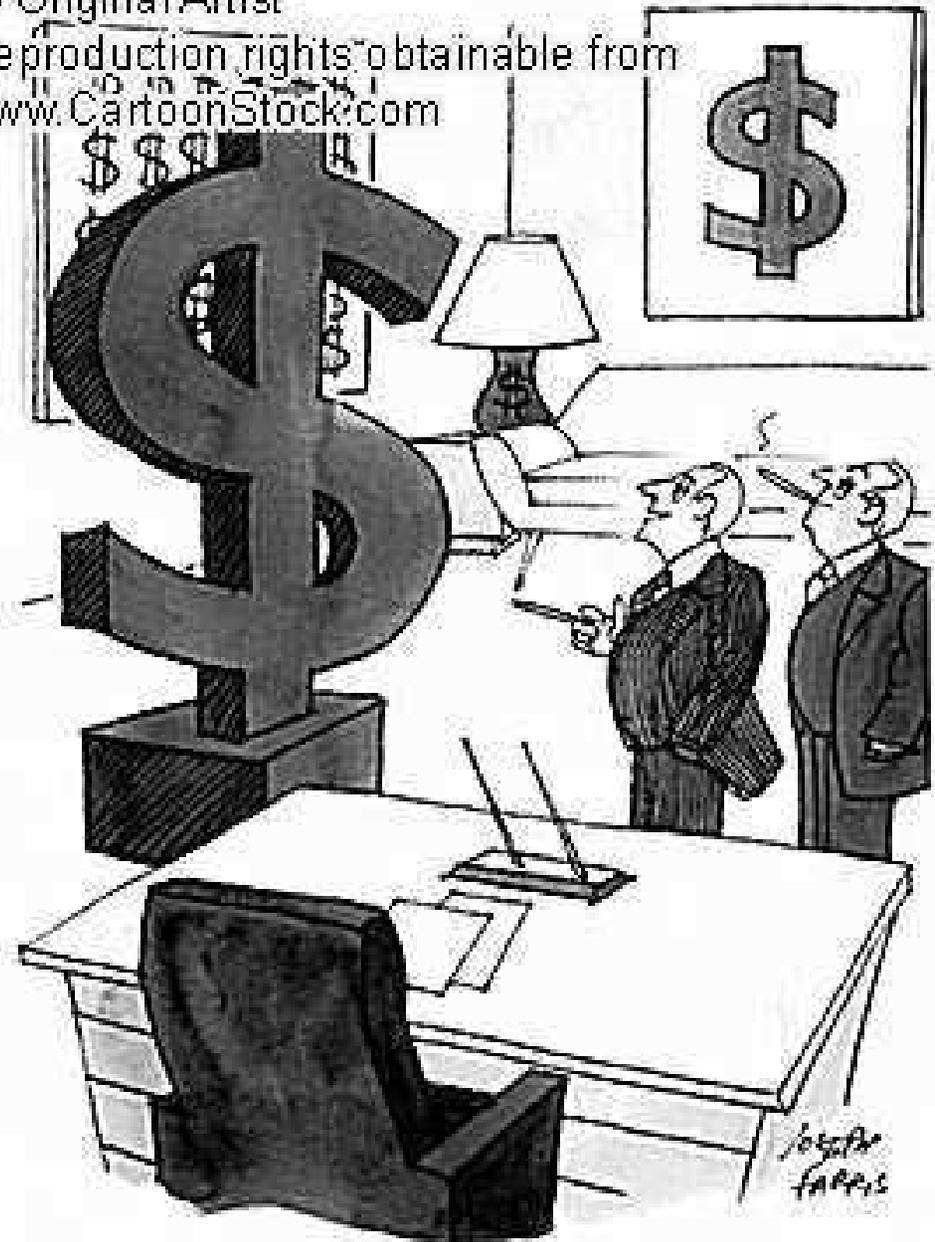

Mixture
Flowchart

- So why do we want to do this?

Why Tighten Mixture Interpretation ?

- Process improvement: why do we want to do this from a management perspective?
- Less time spent means less money. We really have the same amount of resources, but if we can do more cases, this means fewer backlogs, in turn quicker response time. A quicker response time means savings to the investigation.
- Investigative cost curve and the front end loading of case costs.

Investigative cost curve

“Investigative Cost Curve”

Source: G.H. MacLeod, Lab Manager (retired), Royal Canadian Mounted Police Forensic Laboratory, Regina, Saskatchewan, Canada

Reduction in Interpretation Time

- Average interpretation time 4 hours per case estimated
- Estimated 30% savings in interpretation time
- Average output 1 case per 19 hours
- That savings can produce a 6.8% increase in output
- Reduction of 1.3 hours per case permits over 6 additional cases completed per year

Analyst Output

	Cases	Items Examined	DNA Samples
Analyst 1	93	236	290
Analyst 2	100	258	318
Average	97	247	304

Cost Savings Calculation

- The average number of DNA profiles developed for CODIS per case in MCPD is 1.0
- With a total of 130 offender hits (09/2010) out of a total of 773 profiles entered into CODIS, the MCPD hit rate is 16.8 %
- With 6 extra cases per analyst, that would permit one additional hit per analyst annually.

Return on investment

- Prove this approach is a sound investment
- Rapes cost \$111,238 each (1,2)
- Recidivism rate is 8 rapes per rapist
- Cost for each burglary is \$1500 (3)
- Recidivism rate is 20 burglaries per burglar

Montgomery County ROI

- In 2009 CODIS hits on 8 rapes and 24 burglary/robbery cases
- Combined savings of \$6.17 million
- Biology Unit has a estimated cost of \$724,794 annually
- Return on investment is 851%
- \$8.51 for each dollar spent

That is a \$422,000 saving by
improving 6.8% through
implementing improved
interpretation.

Good mixture interpretation guidelines

- Increase consistency
- Reduce conflict
- Improve efficiency
- Save costs
- = HAPPINESS!
