DNA Mixture Interpretation:
History, Challenges, Statistical Approaches, and Solutions

Disclaimers

Funding for research and training on forensic DNA performed by the NIST Applied Genetics Group has come from the National Institute of Justice and the NIST Law Enforcement Standards Office.

Although I chaired the SWGDAM Mixture Committee that produced the 2010 STR Interpretation Guidelines, I cannot speak for or on behalf of the Scientific Working Group on DNA Analysis Methods.

Points of view are mine and do not necessarily represent the official position or policies of the US Department of Justice or the National Institute of Standards and Technology.

Certain commercial equipment, instruments and materials are identified in order to specify experimental procedures as completely as possible. In no case does such identification imply a recommendation or endorsement by the National Institute of Standards and Technology nor does it imply that any of the materials, instruments or equipment identified are necessarily the best available for the purpose.
Understanding Results Obtained & Sharing Them

Data → Stats → Report

Interpretation
Ian Evett on Interpretation

“The crucial element that the scientist brings to any case is the interpretation of those observations. This is the heart of forensic science: it is where the scientist adds value to the process.”

Other STR Loci in the Tested Help Inform the Interpretation

Non-overlapping alleles can help define mixture ratios
Complex Mixture Interpretation is **HARD!!**

Complex mixtures = mixtures of DNA with three or more contributors

Because:

1. Allele share is high

2. **Most complex mixtures have** at least one low template (LT) DNA contributor and therefore **stochastic effects**

3. The parameters used to interpret two person mixtures often may not be directly applied to complex mixtures
Q: Are the 2010 SWGDAM Interpretation Guidelines applicable to all DNA mixtures?

SWGDAM Response: These guidelines were written with single-source samples and two-person mixtures in mind, ... The basic concepts outlined in the 2010 SWGDAM Mixture Interpretation Guidelines hold true as they relate to DNA mixtures of three or more contributors, low-level DNA samples, and mixtures containing biologically related individuals. However, there are nuances and limitations to the interpretation of these more complex mixtures, which are not fully explored in the 2010 guidelines. ...
Statistical Approaches with Mixtures

1. **Random Match Probability (after inferring genotypes of contributors)** – Separate major and minor components into individual profiles and compute the random match probability estimate as if a component was from a single source

2. **Combined Probability of Exclusion/Inclusion** – CPE/CPI (RMNE) – Calculation of the probability that a random (unrelated) person would be excluded/included as a contributor to the observed DNA mixture

   \[ \text{RMNE} = \text{Random Man Not Excluded (same as CPI)} \]
   \[ \text{CPE} = \text{Combined Probability of Exclusion (CPE} = 1 - \text{CPI)} \]
   \[ \text{CPI} = \text{Combined Probability of Inclusion (CPI} = 1 - \text{CPE)} \]

3. **Likelihood Ratio (LR)** – Compares the probability of observing the mixture data under two alternative hypotheses; in its simplest form

   \[ LR = \frac{\Pr(E \mid H_1)}{\Pr(E \mid H_2)} \]
A Brief History of DNA Mixtures (1)

- **1991** – Ian Evett (FSS) publishes Likelihood Ratios (LRs) as a method for DNA mixture interpretation using RFLP data
- **1992** – NRC I (p. 59) mentions Combined Probability of Inclusion (CPI) with a 2-person mixture
- **Early 1990s** – DQA1+PM not effective with mixtures
- **1995** – Mixtures presented in OJ Simpson trial
- **1996** – NRC II (p. 130) advocates LRs over CPI
- **1996** – 9plex STR kits (Profiler Plus, PowerPlex)
- **1997** – Weir et al LRs for mixture statistics
A Brief History of DNA Mixtures (2)

• 1998 – Clayton et al (FSS) DNA mixture deconvolution
• 2000 – initial SWGDAM Interpretation Guidelines published with very little on DNA mixtures
• 2000 – Combined Probability of Inclusion (CPI) statistic is allowed by DNA Advisory Board and pushed by the FBI
• 2000 – 16plex STR kits (PP16 and Identifiler)
• 2005 – NIST Interlaboratory Mixture Study (MIX05) finds extensive variation in laboratory approaches
• 2006 – ISFG Mixture Recommendations published emphasizing that LRs are a better method over CPI
A Brief History of DNA Mixtures (3)

- **2007** – informal SWGDAM study finds most labs doing 2-person mixtures (committee begins writing guidelines)
- **2008** – NIJ study shows value of DNA in burglary cases and more touch DNA samples with complex mixtures begin being processed
- **2010** – SWGDAM Interpretation Guidelines emphasize need for statistics and stochastic thresholds with CPI; probabilistic genotyping approach is mentioned
- **2012** – ISFG publishes LR with probability of dropout to cope with potential of allele dropout
- **2013** – NIST MIX13 study shows variation in approaches
- **2013** – 24plex STR kits (PowerPlex Fusion & GlobalFiler)
- **Present** – a number of software programs exist to help with calculations but no universal approach exists
Historical Perspective on DNA Mixture Approaches

Probabilistic genotyping software in development...

LR commonly used in Europe and other labs around the world

1985 RMNE (CPI) used in paternity testing

1991 Few mixtures

1992 NRC I report (p.59) supports CPI

1996 NRC II report (p.130) supports LR

1997 Weir et al. describe LRs for mixtures

1998 LR commonly used in Europe and other labs around the world

1999 CPI becomes routine in U.S.

2000 DAB Stats (Feb 2000) CPI and LR okay

2006 ISFG DNA Commission LR over CPI

2007 LR with drop-out

2008 NIJ burglary report increases touch evidence

2009 ISFG DNA Commission LR over CPI

2010 SWGDAM guidelines (RMP, CPI, LR)

2012 ISFG DNA Commission LR with drop-out

2013 DNA TL Summit Probabilistic genotyping software in development...

Today

LR = likelihood ratio
CPI = combined probability of inclusion
RMNE = random man not excluded
Published support for CPI approach? (1)

• One of the provided MIX13 laboratory reports cited the 1992 National Research Council report (NRC I) to support their use of the CPI mixture statistic

• NRC I (1992), p. 59:
  – “Typically, it will be impossible to distinguish the individual genotypes of each contributor. If a suspect’s pattern is found within the mixed pattern, the appropriate frequency to assign such a ‘match’ is the sum of the frequencies of all genotypes that are contained within (i.e., that are a subset of) the mixed pattern.” [a description of the CPI statistic]
Published support for CPI approach? (2)

• What does NRC II (1996) say on the topic?
  
  – Page 129: mentions the NRC I, p. 59 statement regarding CPI and illustrates an example calculation.
  
  – Page 130: “That calculation is hard to justify, because it does not make use of some of the information available, namely, the genotype of the suspect. The correct procedure, we believe, was described by Evett et al. (1991).” [i.e., the likelihood ratio approach]

Why are we where we are today?

• The incredible success of DNA has lead to more sensitive methods and more samples being provided which has led to more complex mixtures (we are pushing the envelope)
  – Lower template DNA profiles have more uncertainty associated with them in terms of allele peak height variation

• Statistical interpretation techniques have not kept pace with the methodology improvements
  – Much of the forensic DNA community is effectively using a 1992 statistical tool on 21st century data
A Complexity/Uncertainty Threshold

*New Scientist* article (August 2010)

- How DNA evidence creates victims of chance
  - 18 August 2010 by Linda Geddes

- From the last paragraph:
  - In really complex cases, analysts need to be able to draw a line and say "This is just too complex, I can't make the call on it," says Butler. "Part of the challenge now, is that every lab has that line set at a different place. But the honest thing to do as a scientist is to say: I'm not going to try to get something that won't be reliable."

Perhaps We Should Slow Down with Some of the DNA Mixtures That We (Scientists and Lawyers) Are Taking On…

Poor Quality Conditions

- Slick, mountain road
- Curve, poor visibility
- Foggy, wet conditions

Large Numbers of Contributors

- Wet surface leads to hydroplaning
