

The Role of DNA in Kinship Analysis

Kristen E. Lewis, Ph.D.

National Institute of Standards and Technology
Biochemical Science Division
Applied Genetics Group – DNA Biometrics Project

Lockheed Martin BEACON Lecture
April 14, 2010

Outline

- Forensic DNA analysis / DNA biometrics
- Complex kinship testing
- Kinship analysis software

Forensic DNA Analysis

DNA Biometrics

Steps in Forensic DNA Analysis

Usually 1-2 day process (a minimum of ~8 hours)

Blood Stain Sample
Buccal swab Collection
& Storage

DNA
Extraction

DNA
Quantitation

Biology

Multiplex PCR Amplification

DNA separation and sizing

STR Typing
Interpretation of Results

Technology

Statistics Calculated

DNA database search

Paternity test

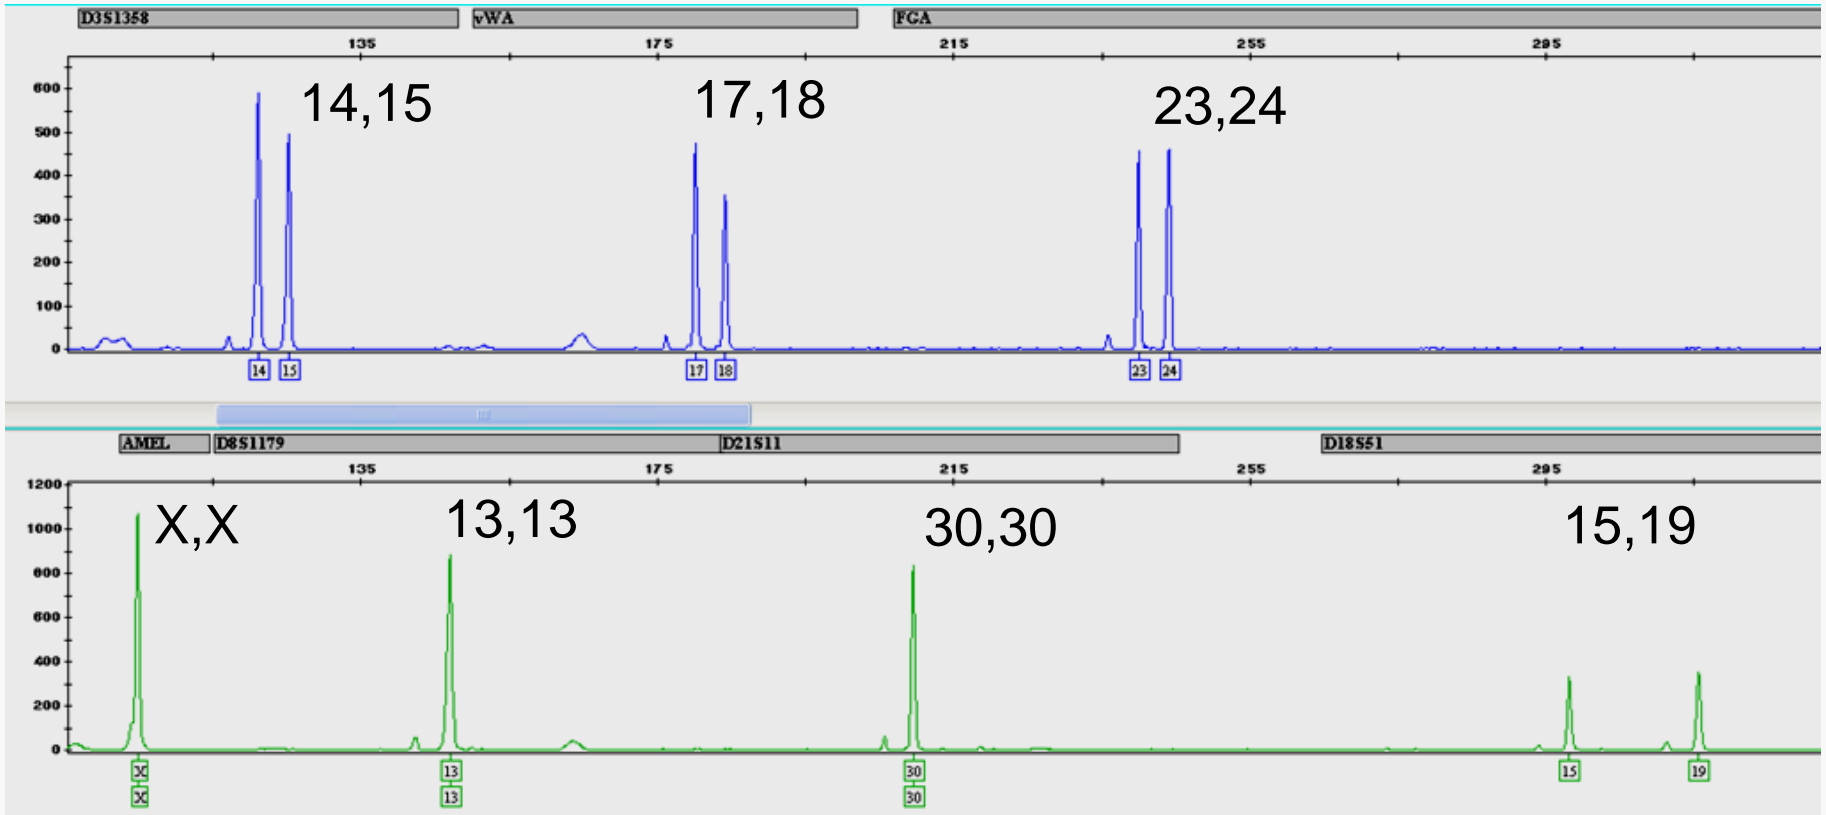

Reference sample

Applied Use of Information

Genetics

Forensic DNA Typing

Example of 6 markers + sex-typing marker

A common set of 13 Short Tandem Repeat (STR) markers (“CODIS loci”) are genotyped to search state and national databases

DNA Typing as a Biometric

Advantages

- High level of accuracy
(Gold Standard)
- Solid foundation of forensic DNA testing
(pop stats, molecular biology, protocols, training, court acceptance, education)
- **Kinship analysis** (unique to DNA)
- Potential use for:
 - Phenotype (traits; eye/hair color)
 - Ancestry

Challenges

- Expensive
- **Time consuming**
- Sample collection (invasive, stability issues)
- Technical expertise required for analysis
- Low level template, mixtures, PCR inhibition
- Policy/Privacy/Ethical issues

Interest in Rapid DNA Typing

- DoD (field testing, rapid intelligence, mass fatalities)
- DHS (kinship determination, border security, immigration)
- DoJ (law enforcement, initial information)
- Industry (security, authentication)

Rapid DNA Typing Systems under Development

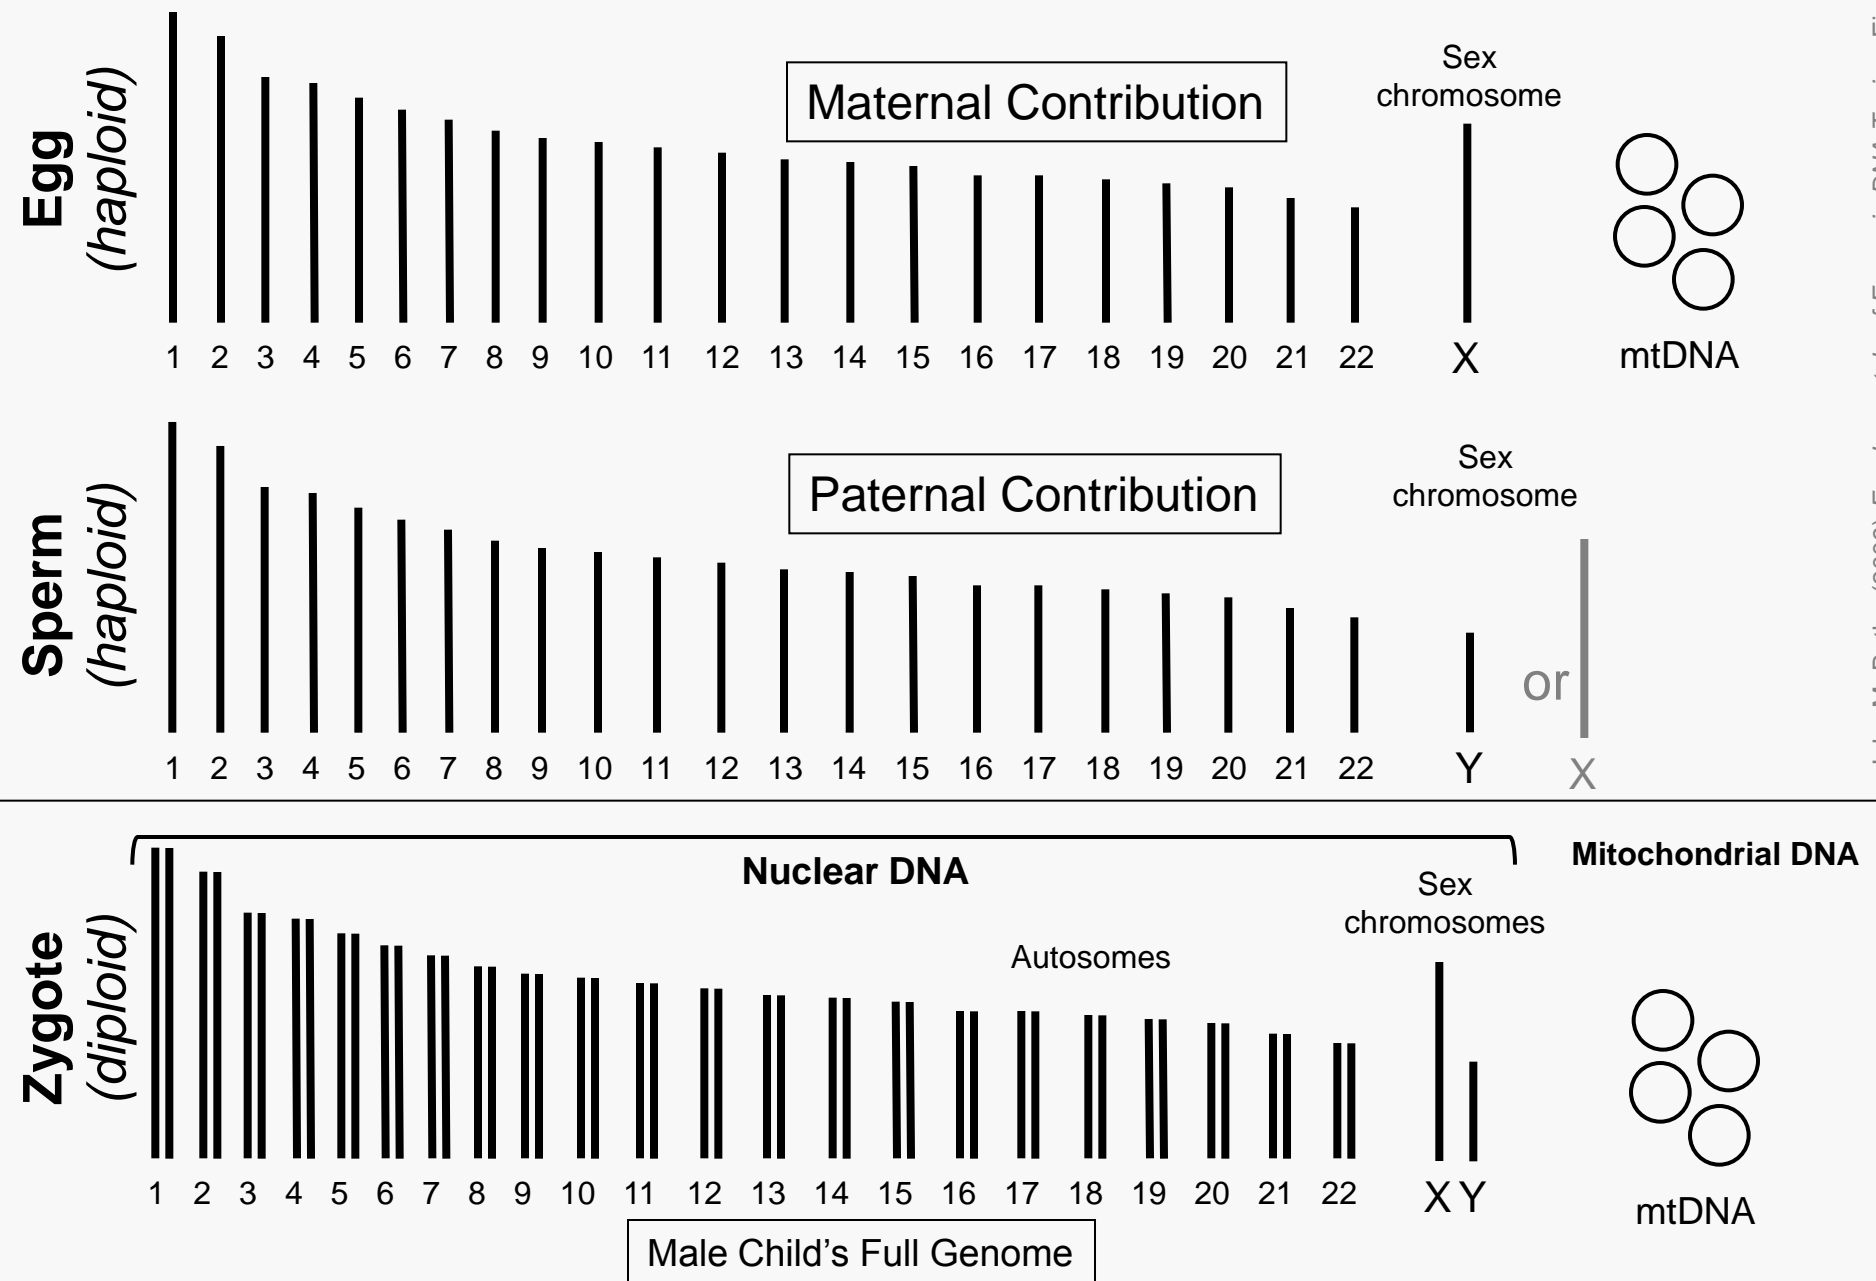

- Systems are currently under development and are not yet commercially available
- Network Biosystems (Woburn, MA)
<http://www.netbio.com>
- MicroLab Diagnostics and Lockheed Martin (Charlottesville, VA)
<http://www.microlabdiagnostics.com>
- Microchip Biotechnologies, Inc. (Pleasanton, CA)
<http://www.microchipbiotech.com>
- Forensic Science Service (UK)
<http://www.forensic.gov.uk/>

Using DNA to Detect Genetic Relationships

- DNA profiles can be used to evaluate the probability of a specific kinship relationship
- Various situations
 - Paternity (civil and criminal)
 - Familial searching
 - Mass disasters
 - Unidentified human remains
 - Inheritance
 - Immigration
 - Military intelligence

Human Genome and Inheritance

Autosomal Paternity Example

Alleged Father

Mother

Focusing on 5 markers...

Autosomal Paternity Example

Alleged Father

Child

Mother

Focusing on 5 STR markers...

Different Inheritance Patterns

CODIS STR Loci

Autosomal
(passed on in part,
from all ancestors)

Lineage Markers

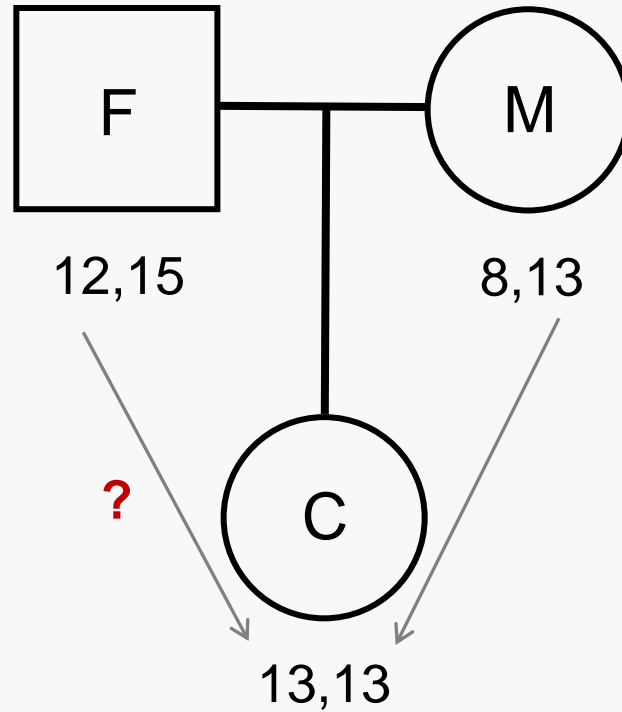

Y-Chromosome
(passed on complete,
but only by sons)

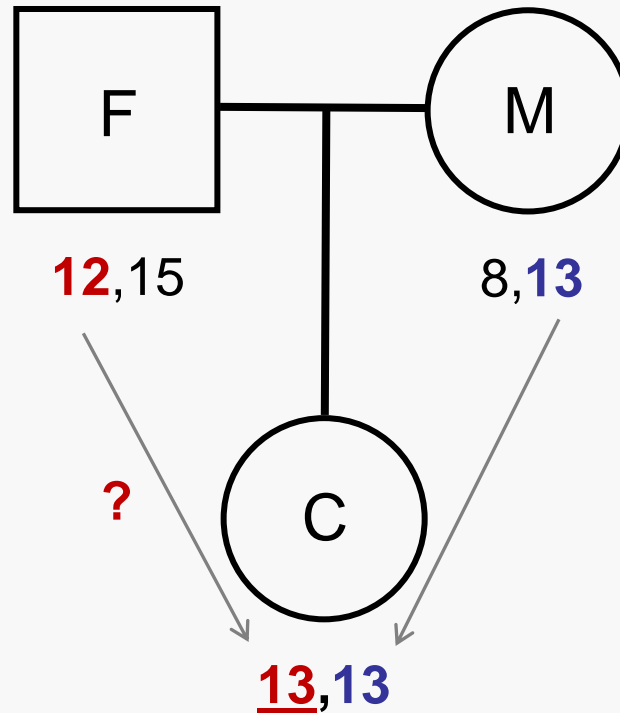

Mitochondrial
(passed on complete,
but only by daughters)

Mutation of STR Markers

Mutation of STR Markers

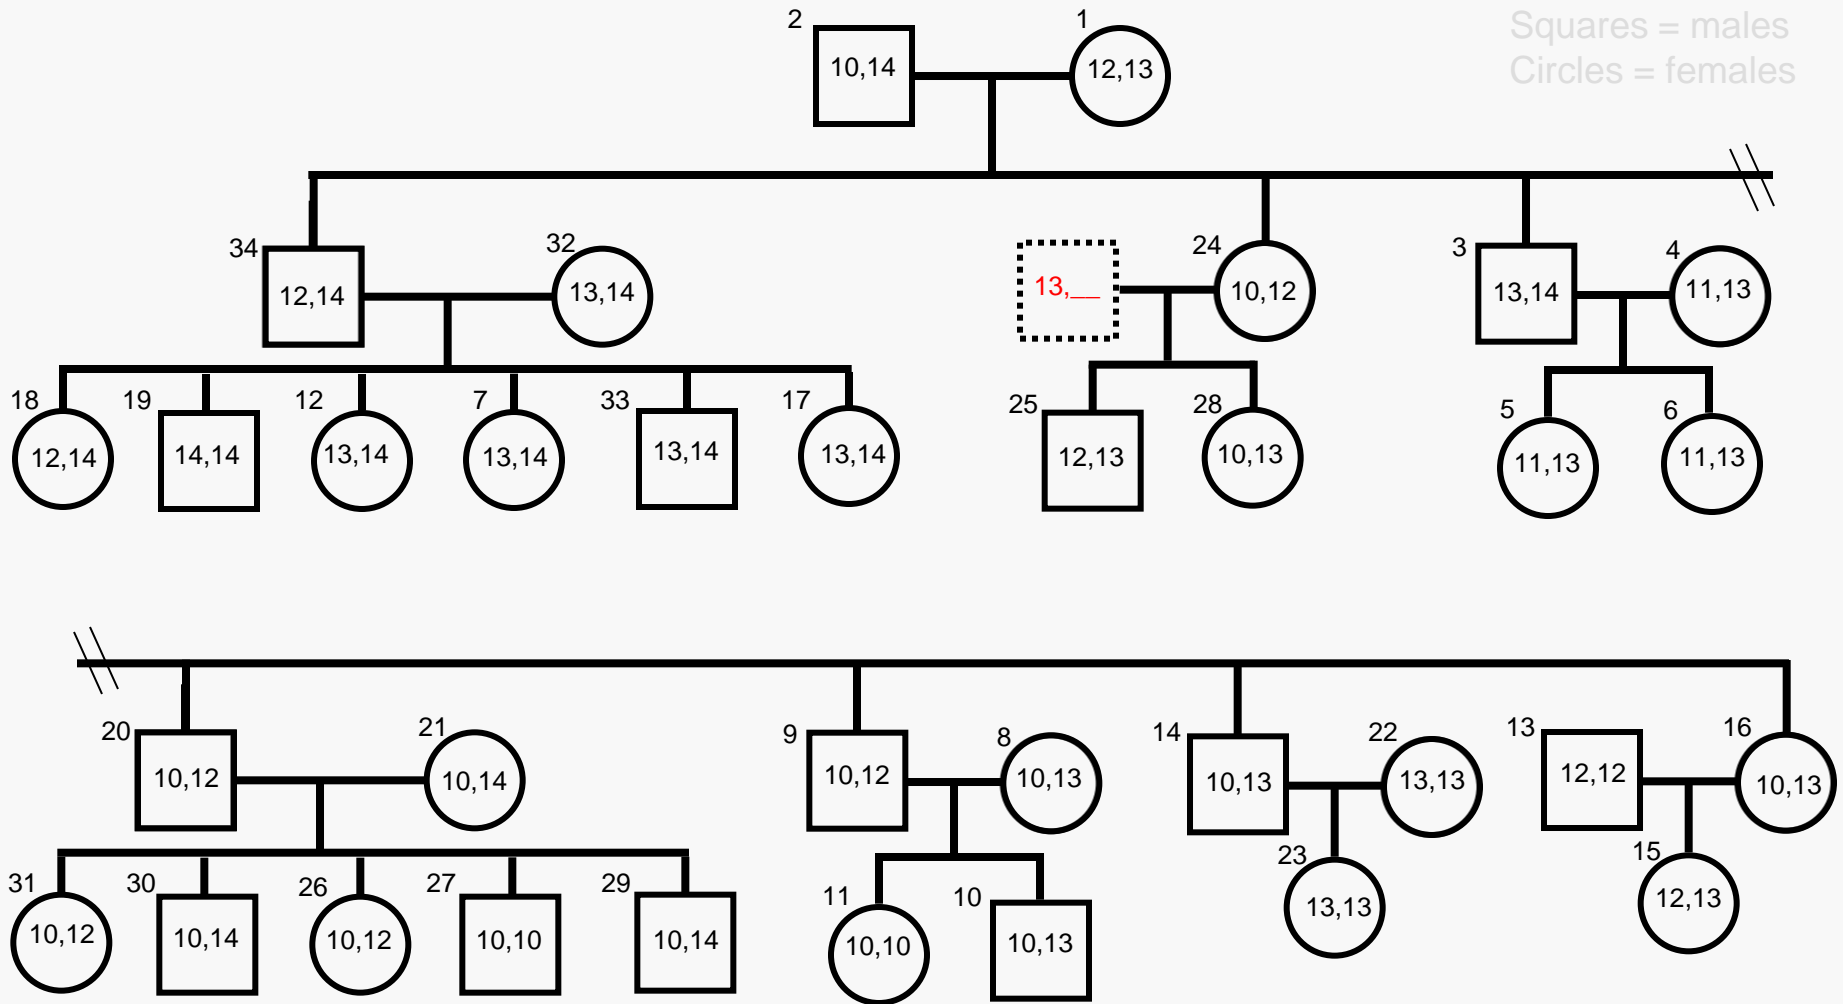

- Typically observe 1-step mutations (99%)
- Gain or loss of repeat unit possible
- Average STR mutation frequency = 0.001
- Must factor in mutation for kinship analyses

Extended Family Samples

- 6 sets of family samples (3 - 4 generations)
- N = 165 (total samples)
- Loci examined
 - 43 autosomal loci (13 CODIS + 2, 25 NIST loci, PowerPlex ESI 17, NGM loci)
 - 17 Y-chromosomal loci (Yfiler loci)
 - 15 X-STRs (AFDIL collaboration)
 - Mitochondrial control region (to be typed)
- These samples are being used to illustrate the value (or limitations) of current and additional marker systems

Extended Family Samples

Family Pedigree with STR Marker **D8S1179**

Examine Basic Allele Sharing

| Marker | Father | Mother |
|------------|--------|---------|
| 1 CSF1PO | 10 10 | 10 12 |
| 2 TPOX | 8 8 | 8 10 |

| 15 D19S433 | 12 | 14 | 14 | 14 |

Evaluating Relatedness

- Examining or counting shared alleles is qualitative
- Likelihood ratio can be used to help quantify the information

$$LR = \frac{\text{Probability of data under one hypothesis}}{\text{Probability of data under alternative hypothesis}}$$

Likelihood Ratio Equations

Motherless Paternity Case

| Genotype Combinations at One Marker | | Likelihood Ratio |
|-------------------------------------|---------------------------|-----------------------|
| Child's Genotype | Alleged Father's Genotype | |
| AA | AA | $1/p_A$ |
| AA | BB | 0 |
| AA | AB | $1/2p_A$ |
| AA | BC | 0 |
| AB | AB | $(p_A + p_B)/4p_Ap_B$ |
| AB | AC | $1/4p_A$ |
| AB | CD | 0 |

Multiply LR across all loci

$$LR = \frac{\text{Probability of data if the alleged father is the true father}}{\text{Probability of data if an unrelated man is the true father}}$$

Allele Sharing Probabilities

| Relationship | 0 alleles | 1 alleles | 2 alleles |
|------------------------|------------------|------------------|------------------|
| Parent-child | 0 | 1 | 0 |
| Full siblings | 1/4 | 1/2 | 1/4 |
| Half siblings | 1/2 | 1/2 | 0 |
| Cousins | 3/4 | 1/4 | 0 |
| Uncle-nephew | 1/2 | 1/2 | 0 |
| Grandparent-grandchild | 1/2 | 1/2 | 0 |

Half siblings, uncle-nephew,
and grandparent-grandchild are genetically identical.

Complex Kinship Testing

The statistical power for complex kinship testing significantly decreases compared to **one-to-one** matching

Requirements:

- **Genotypes** of individuals being tested
- **Allele frequencies** for the loci involved in the testing
- **A Hypothesis!**
- Basic statistical equations are known
- Difficult to identify distant relationships
- Discriminatory power comes from multiple family members and the use of informative markers

Likelihood Ratios with 15 Loci

| Comparison | LR for 34 & 19 | LR for 18 & 19 | LR for 34 & 10 |
|------------------------|----------------|----------------|----------------|
| Parent-Child | 1.28E+06 | | |
| Full Siblings | | 2.76E+07 | |

15 STR loci typed with commercial Identifiler kit
 25 STR loci typed with an in-house NIST assay

Hill, C.R., Butler, J.M., Vallone, P.M. (2009) A 26plex autosomal STR assay to aid human identity testing. *J. Forensic Sci.* 54(5): 1008-1015.

What would Mitochondrial sequencing tell you?

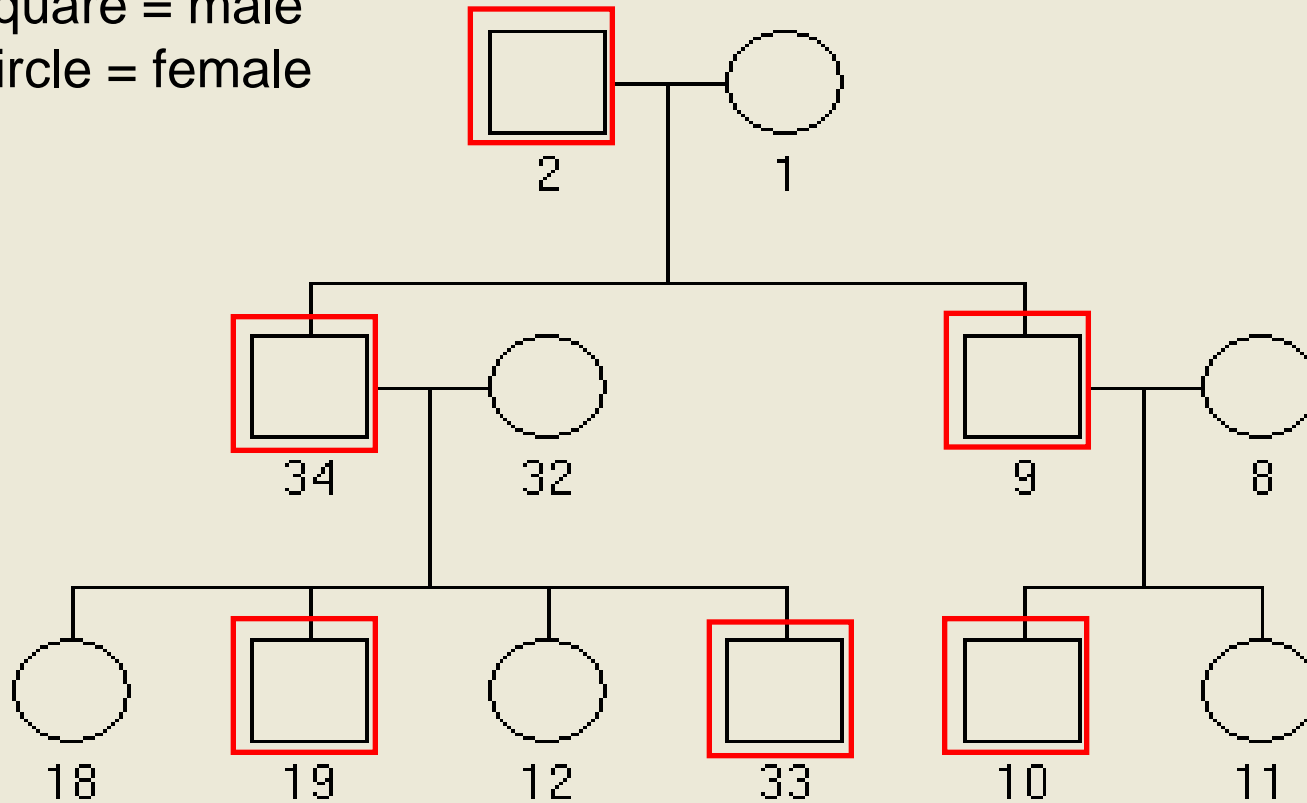

Square = male
Circle = female

Mitochondrial DNA is maternally inherited

What would a Y-STR test tell you?

Square = male
Circle = female

| Y STR | Allele |
|-----------|--------|
| DYS456 | 17 |
| DYS389I | 13 |
| DYS390 | 24 |
| DYS389II | 29 |
| DYS458 | 18 |
| DYS19 | 14 |
| DYS385 | 11 |
| DYS385 | 15 |
| DYS393 | 13 |
| DYS391 | 11 |
| DYS439 | 13 |
| DYS635 | 23 |
| DYS392 | 13 |
| Y_GATA_H4 | 12 |
| DYS437 | 15 |
| DYS438 | 12 |
| DYS448 | 19 |

All males in this specific lineage have the identical Y-STR profile

Likelihood Ratios with Y-STR Loci

| Y STR | Allele |
|-----------|--------|
| DYS456 | 17 |
| DYS389I | 13 |
| DYS390 | 24 |
| DYS389II | 29 |
| DYS458 | 18 |
| DYS19 | 14 |
| DYS385 | 11 |
| DYS385 | 15 |
| DYS393 | 13 |
| DYS391 | 11 |
| DYS439 | 13 |
| DYS635 | 23 |
| DYS392 | 13 |
| Y_GATA_H4 | 12 |
| DYS437 | 15 |
| DYS438 | 12 |
| DYS448 | 19 |

Y-STR profile frequency = 0.00009

For father-son (34 vs 19):
LR = 1 / 0.00009 = 1.1E+04
LR with 40 autoSTRs = 6.68E+16

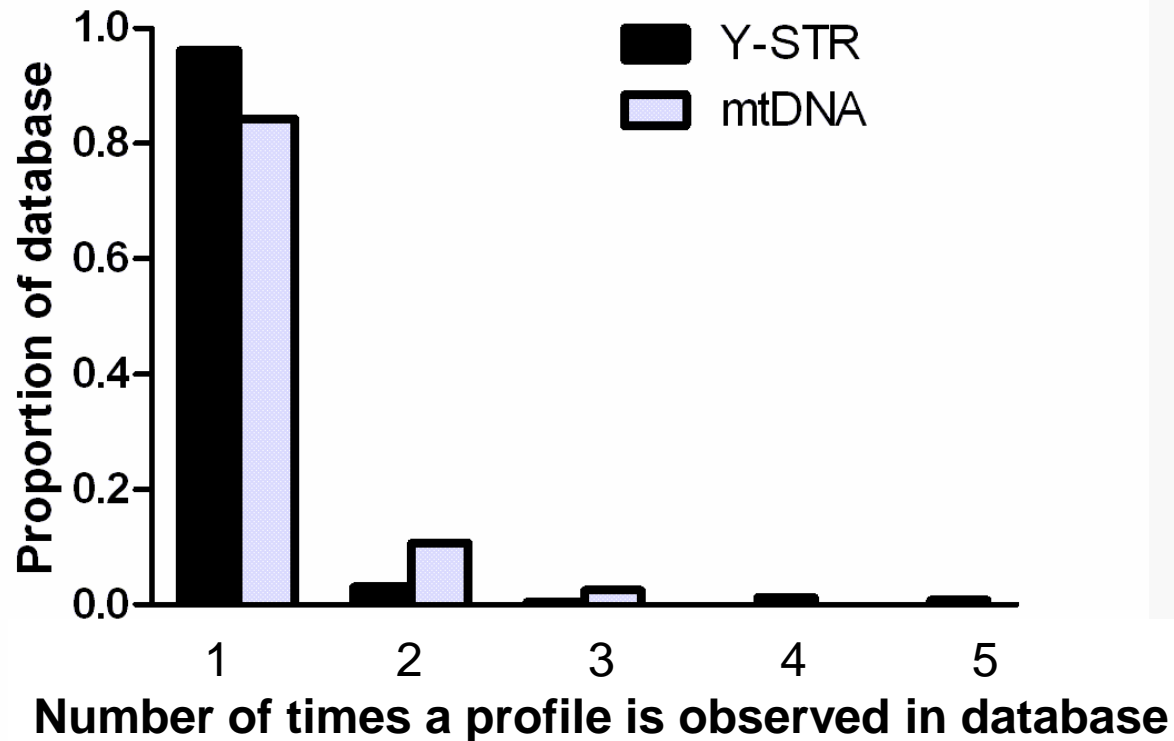

For uncle-nephew (34 vs. 10):
LR = 1 / 0.00009 = 1.1E+04
LR with 40 autoSTRs = 8.98E+05

BUT...

For brother vs. sister (19 vs 18):
LR = 0
LR with 40 autoSTRs = 1.57E+19

Lineage markers may not be as statistically robust as autosomal markers, but they are lineage specific and can link distant relatives.

Frequency of Y-STR and mitochondrial DNA profiles in the NIST population database (n = 572)

96% of Y-STR profiles are unique
84% of mtDNA profiles are unique

Simulated Datasets

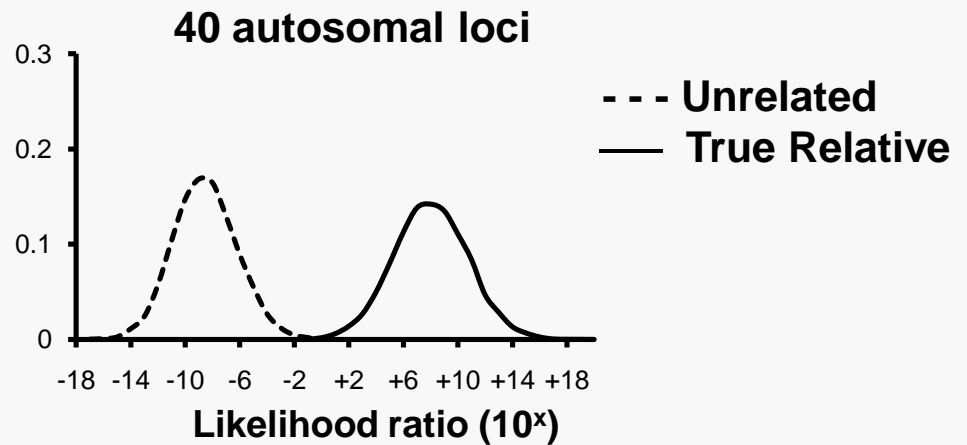

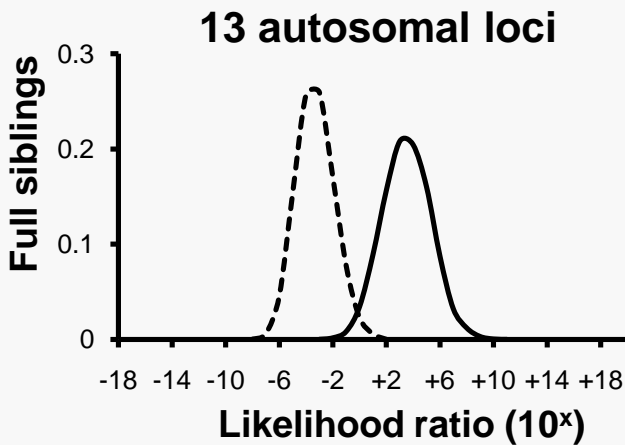

Probability of finding a true parent-offspring relative and the number of false positives (LR threshold $\geq 100 = 10^2$)

| Loci | Probability of true relative | Number of false positives |
|------|------------------------------|---------------------------|
| 13 | 0.95 | 18 |
| 40 | 1.00 | 0 |

Based on a database of 100,000 individuals with U.S. allele frequencies.

Probability of finding a true full sibling relative and the number of false positives (LR threshold $\geq 100 = 10^2$)

| Loci | Probability of true relative | Number of false positives |
|------|------------------------------|---------------------------|
| 13 | 0.70 | 5 |
| 40 | 0.97 | 0 |

Based on a database of 100,000 individuals with U.S. allele frequencies.

Probability of finding a true half sibling relative and the number of false positives (LR threshold $\geq 10 = 10^1$)

| Loci | Probability of true relative | Number of false positives |
|------|------------------------------|---------------------------|
| 13 | 0.73 | 4,570 |
| 40 | 0.83 | 607 |

Based on a database of 100,000 individuals with U.S. allele frequencies.

Immigration: Kinship Analysis as a DNA Biometric

US Citizenship and Immigration Services (USCIS)

- Immigration cases
 - 1,107,126 obtained legal permanent residence in US in 2008
 - 103,456 were relatives of US alien resident
- Refugee/asylum cases
 - 400 applications processed per day
 - 60,108 refugees admitted in 2008
 - 34,753 were relatives of applicant
- Support relationship claim with interview and documents
- Fraudulent claims (79%)

Current: Optional DNA Testing for Immigration

- DNA may be used if interview and documents are insufficient
- Number of cases:
 - ~ One dozen accredited labs in US
 - ~ 3,500/yr for small lab, ~10,000/yr large lab
- Time: Minimum two-day lab analysis; up to six months to coordinate with embassy
- Cost: \$600-\$1500 for private lab testing
 - Applicant pays (usually US resident, “anchor”)

Future: Requiring DNA for Immigration Testing

- Easy, rapid collection
 - Trained embassy/field office staff vs. accredited physician
 - Buccal swab
- Faster, cheaper testing
 - Not necessary to have one-hour turnaround time
 - Relationship in question could dictate the markers to be analyzed
- Analysis
 - Expert system may not give definitive answer
 - May help to flag DNA quality or genotyping issues
 - Analysts trained in statistics and kinship analysis may be necessary
- Perform on-site or in US government lab? Outsource to private lab?
- Many more questions...
 - Volume? Cost? Population allele frequencies? Level of certainty?

Analysis Software

Expert Systems

- Programs that interpret data as a human expert would
- Expert systems for forensic typing (NDIS-approved)
 - FSS-I³ (FSS/Promega)
 - GeneMapper ID-X (Applied Biosystems)
 - TrueAllele (CyberGenetics)
- Expert systems for kinship analysis
 - No program has been designated as an expert system for automated kinship determination

Inconclusive?

Missing relatives?

Kinship Analysis Software

- Public/commercial availability
 1. GeneMarker[®] HID v1.90 (SoftGenetics)
 2. DNA-VIEW[™] v29.11 (Charles Brenner)
 3. LISA (Future Technologies Inc.)
 4. KIn CALc v3.1 (CA DOJ)
- Restricted availability
 5. CODIS 6.0 (FBI)
- Coming soon
 6. FSS-ibd (Forensic Science Service)

(1) GeneMarker[®] HID

- Fragment analysis program, primarily
- Kinship module
 - Draw pedigree tree (show inheritance conflicts)
 - LR approach
 - Pairwise analysis only
- Databases of allele frequencies, loci
 - Autosomal STRs, Y-STRs
 - No mitochondrial DNA

(2) DNA-VIEW™

- DOS, command-line interface
- Kinship modules
 - Paternity and complex kinship analyses
 - Pedigree simulations
 - Define relationships (pedigree tree) with symbols
 - Use up to 10 relatives in analysis
 - LR approach
- Databases of allele frequencies, loci
 - Autosomal STRs or Y-STRs
 - No mitochondrial DNA for kinship
 - Mutation considered

(3) LISA

- Laboratory Information Systems Application
- Originally developed for AFDIL
- Graphical interface for DNA-VIEW™
- Uses Progeny® to draw pedigree trees
- Autosomal STRs, Y-STRs, mtDNA

(4) KIn CALc

- Excel, macro-driven program
- Kinship module
 - Define relationships on pedigree tree
 - Use up to 10 relatives in analysis
 - LR approach based on DNA-VIEW algorithms
 - No mutation calculation (flags mutation)

Mutation

Per locus likelihood ratios

(5) CODIS 6.0

- FBI-developed program for missing persons and unidentified human remains identification
- Kinship module
 - Draw pedigree tree to define relationships
- Joint Pedigree LR
 - Ranks putative relatives
- Database of allele frequencies, loci
 - Autosomal STRs, Y-STRs, mtDNA
 - Metadata in v. 7.0

(6) FSS-ibd

- Automated relationship testing application
- Graphical user interface
- Simple paternity to complex kinship
- LR approach
- Database of allele frequencies, loci
 - Provided and user-defined
 - Autosomal STRs
 - Mutation considered

FSS-ibd

The screenshot displays the FSS-ibd software interface. The main workspace shows a kinship diagram with the following structure:

- Quickstart1 (Hexagon) is the root node.
- Quickstart1 has three children: Putative Father (Square), Mother (Circle), and Random Male (Square).
- Putative Father and Mother are connected to a central node (Triangle).
- The central node is connected to Child (Square).

The interface includes several panels:

- Hypothesis Explorer:** Lists Hypothesis 1 and Hypothesis 2, each with sub-items: Genepool, Females, Males, Random Male, Putative Father, Child, and Sex Unknown.
- Shape Palette:** Shows various shapes and patterns used in the diagram.
- Properties:** A form for the selected node (Putative Father) with fields for Name, Sex (Male), Deceased, Ad. Rel. (Parent), Sample no. (304123), Sample date, and Date of Birth.
- Table:** A table with columns for Marker, Allele1, and Allele2, containing data for markers D3, D16, D2, D8, D21, D18, and D19.

At the bottom, the status bar indicates "Ready for processing", "Scale: 100%", and "Mode: Administrator".

| Marker | Allele1 | Allele2 |
|--------|---------|---------|
| D3 | 14 | 15 |
| D16 | 9 | 12 |
| D2 | 17 | 18 |
| D8 | 8 | 9 |
| D21 | 27 | 28 |
| D18 | 12 | 14 |
| D19 | 11 | 13 |

Software Validation

Validation information: <http://www.cstl.nist.gov/strbase/validation.htm>

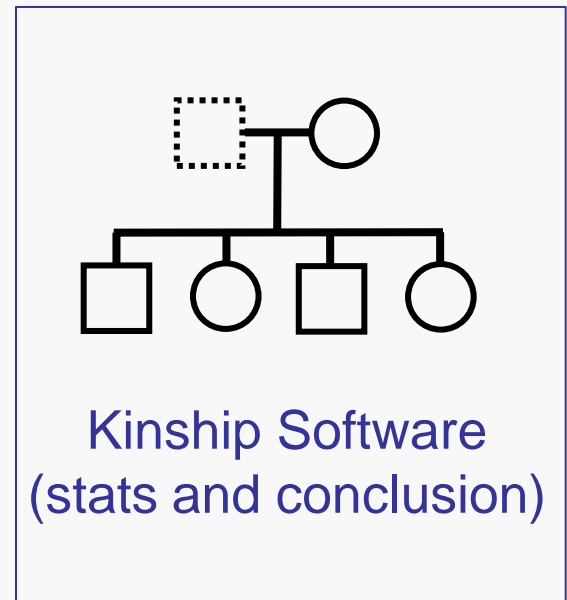

- Developmental validation (manufacturer)
- Internal validation (individual labs)

Internal Validation Considerations for Kinship Software

- Who should recommend validation guidelines for DNA Biometrics and kinship analysis?
 - For forensic typing: Scientific Working Group on DNA Analysis Methods
 - For paternity testing: AABB
- Define case examples to test software
 - Paternity trios, deficient cases, complex kinship, false relationships
 - How many cases are enough?
 - Real data, simulated, or both?
- Technical considerations specific to testing
 - Marker systems, allele frequency data, mutation, LR threshold, etc.
- How do you know your answer is correct?
 - Compare to hand-calculated answer or to another kinship program?

Drábek J, Validation of software for calculating the likelihood ratio for parentage and kinship, FSI:Genetics 3 (2009) 112–118

Conclusions

- DNA is a powerful tool to confirm or refute alleged familial relationships
 - Important to define specific kinship questions
- Simulations with appropriate allele frequency databases can model expected LR values for specific relationships
- Software must be “fit for purpose”
- Can there be an expert system for kinship analysis?
- What are the validation parameters? Who should define validation guidelines?

Thank you for your attention
